

GStreamer

Audio Applications

What is GStreamer

- Graph based multimedia framework
- Open source
- Cross platform
 - Linux, Windows, MacOS, Symbian, ...
- Multiple languages
 - C, C++, C#, Java, Perl, Python, Vala, ...

<http://www.gstreamer.net>

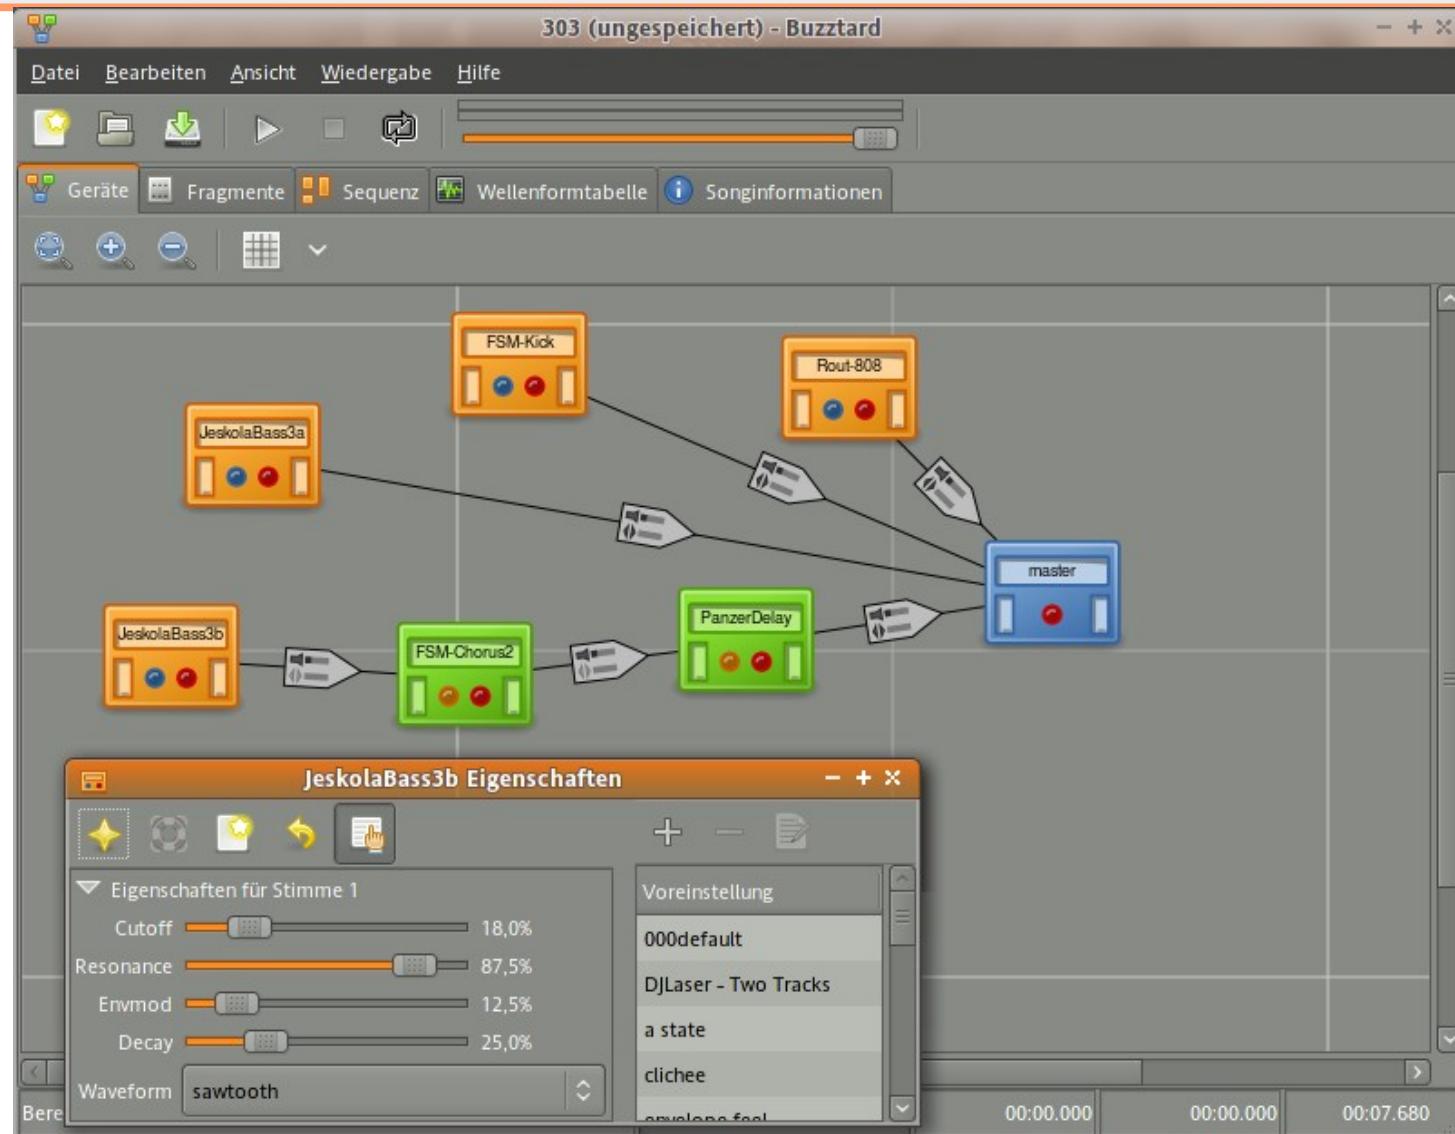

What is GStreamer used for

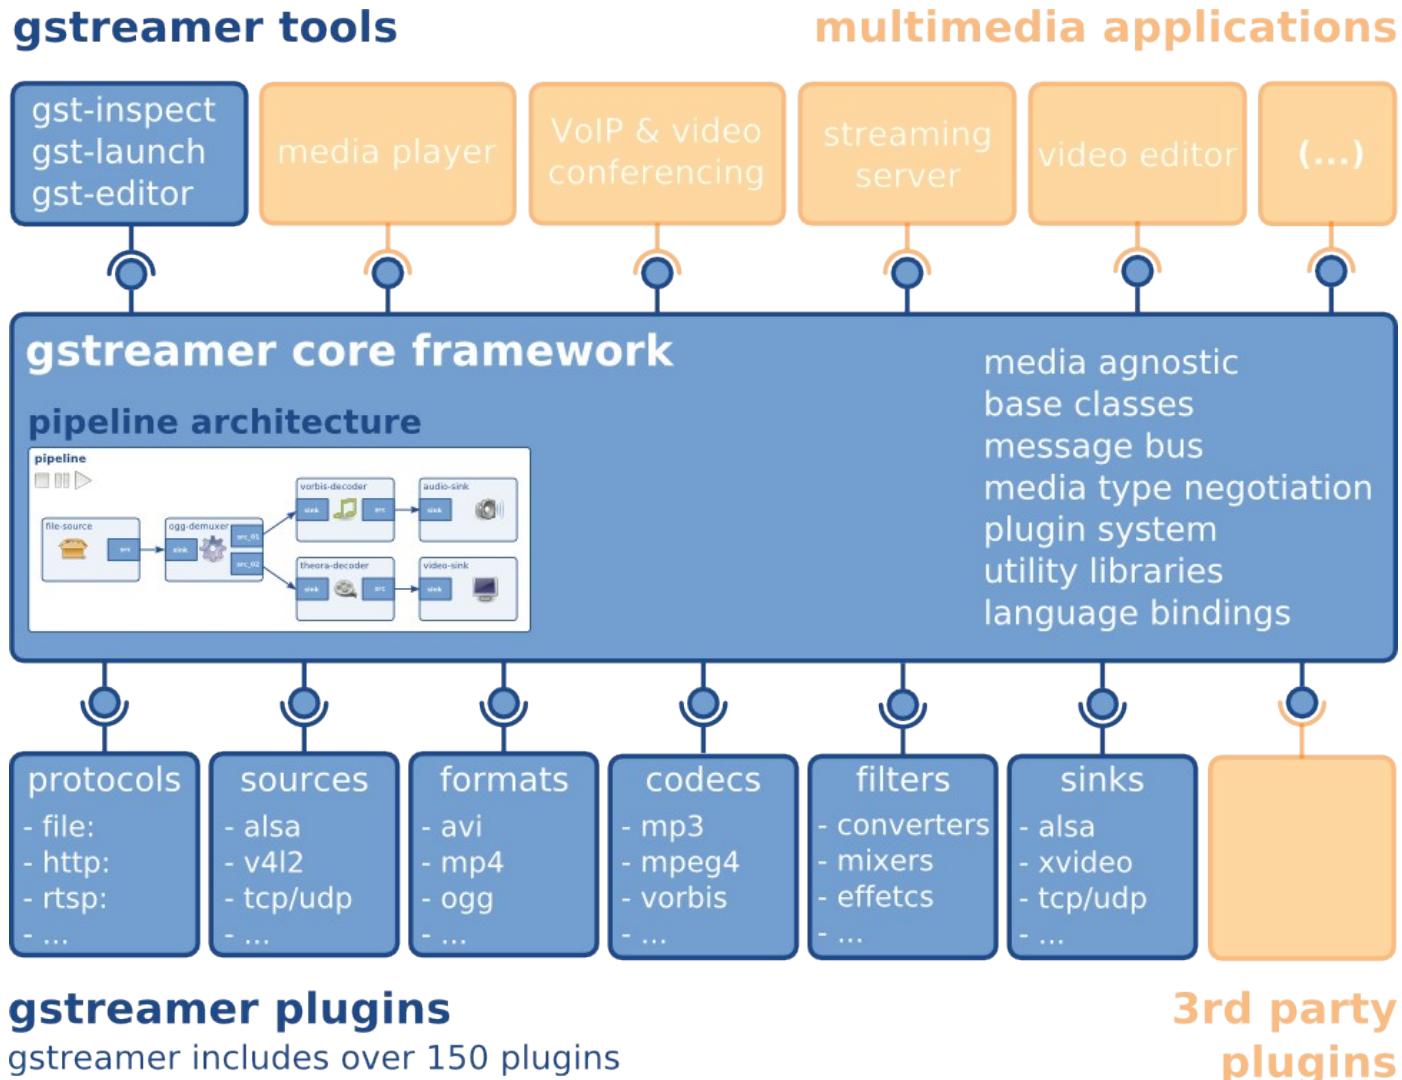

- Media players
- Video editors
- Voip and Video call
- Music editors/composers
- Camera capture
- Transcoding
- ...

What is Buzztard

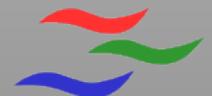

Concepts

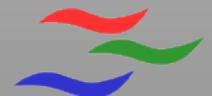

GStreamer Core

- Pipeline layout
 - Elements, Bins and Pads
- Communication
 - Buffers, Events, Queries and Messages
- Scheduling
 - Tasks, Queues and Clocks
- Registry

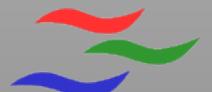

GStreamer Core Libs

- Base Classes
 - BaseSrc, BaseTransform, BaseSink, ...
- Check
 - Testing support
- Controller
 - Parameter automation
- ...

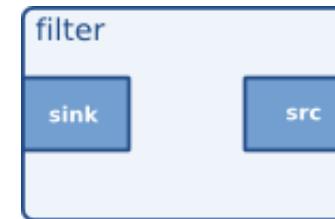

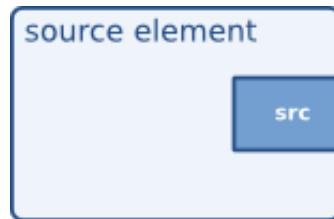

GStreamer Plugins Base Libs

- Core is media agnostic
- `gst-plugin-base` introduces
 - Audio/Video baseclasses and utilities
 - Lots of helper libraries

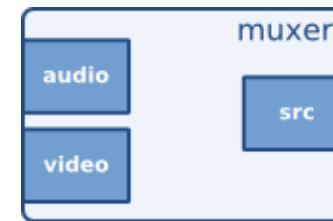

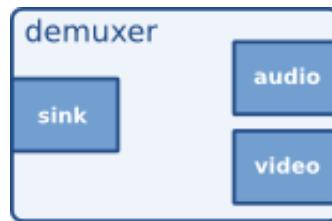

Elements

- Elements with static pads

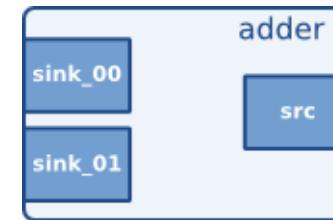

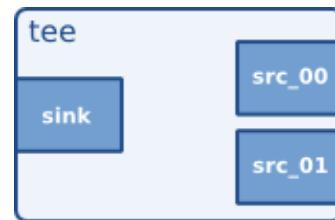

Elements

- Elements with "sometimes" pads

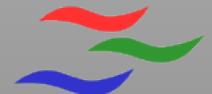

- Elements with "request" pads

Pads

- Pads are connectors
- Elements have PadTemplates
- Pads are created from PadTemplates

Caps

- PadTemplates have Caps

```
audio/x-raw-float
```

```
    rate: [ 1, 2147483647 ]
```

```
    channels: [ 1, 2147483647 ]
```

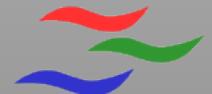

```
    endianness: 1234
```

```
    width: { 32, 64 }
```

```
audio/x-raw-int
```

```
...
```

- Pads have caps too

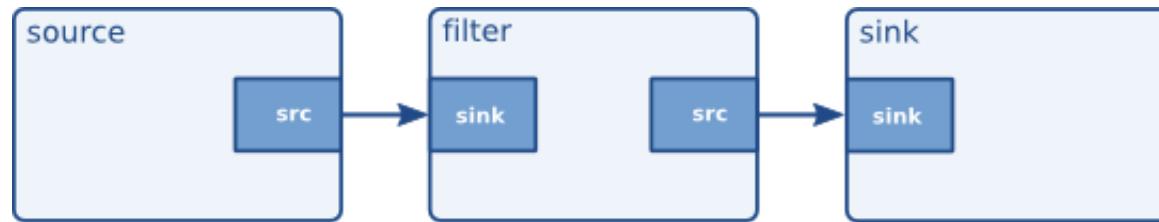

RAW Audio Caps

- good support for multi-channel audio
- audio is interleaved!
 - LRLRLRLR instead of LLLLRRRR
- Non interleaved support would be nice to have

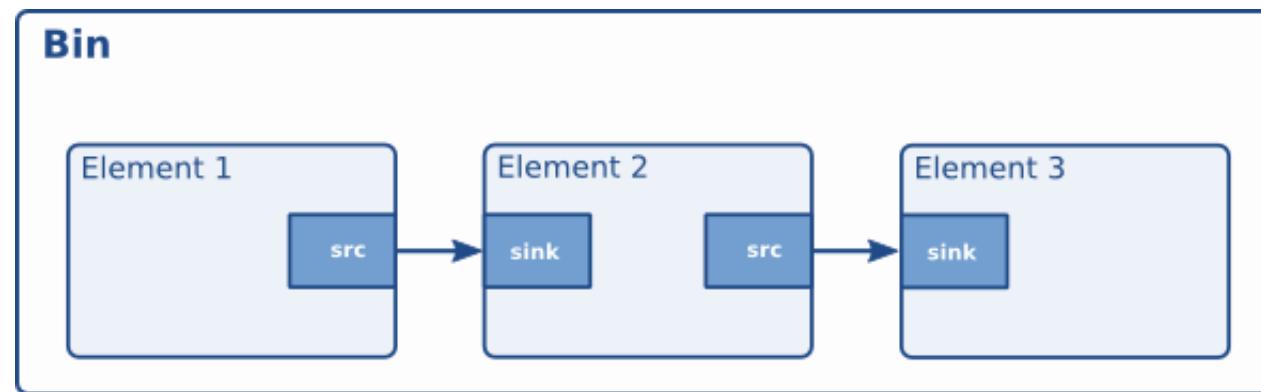

Links

- Elements are linked by linking their pads
- It is always src -> sink
- Caps of PadTemplates need to be compatible

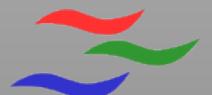

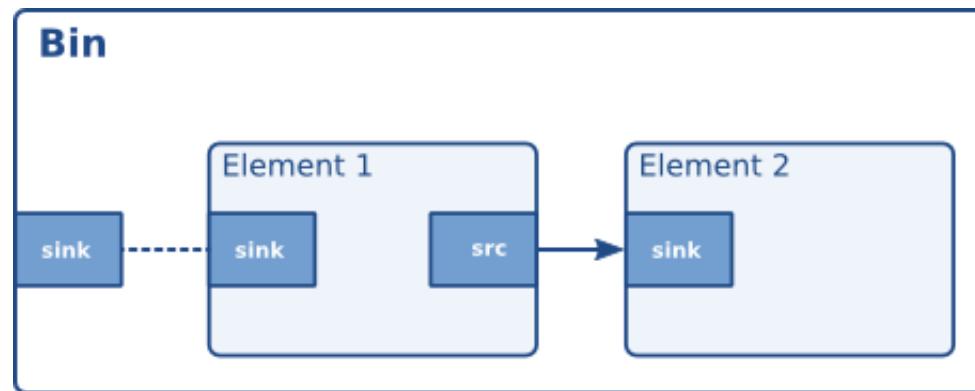

Bins

- Elements can be grouped
- Bins **are** elements themself

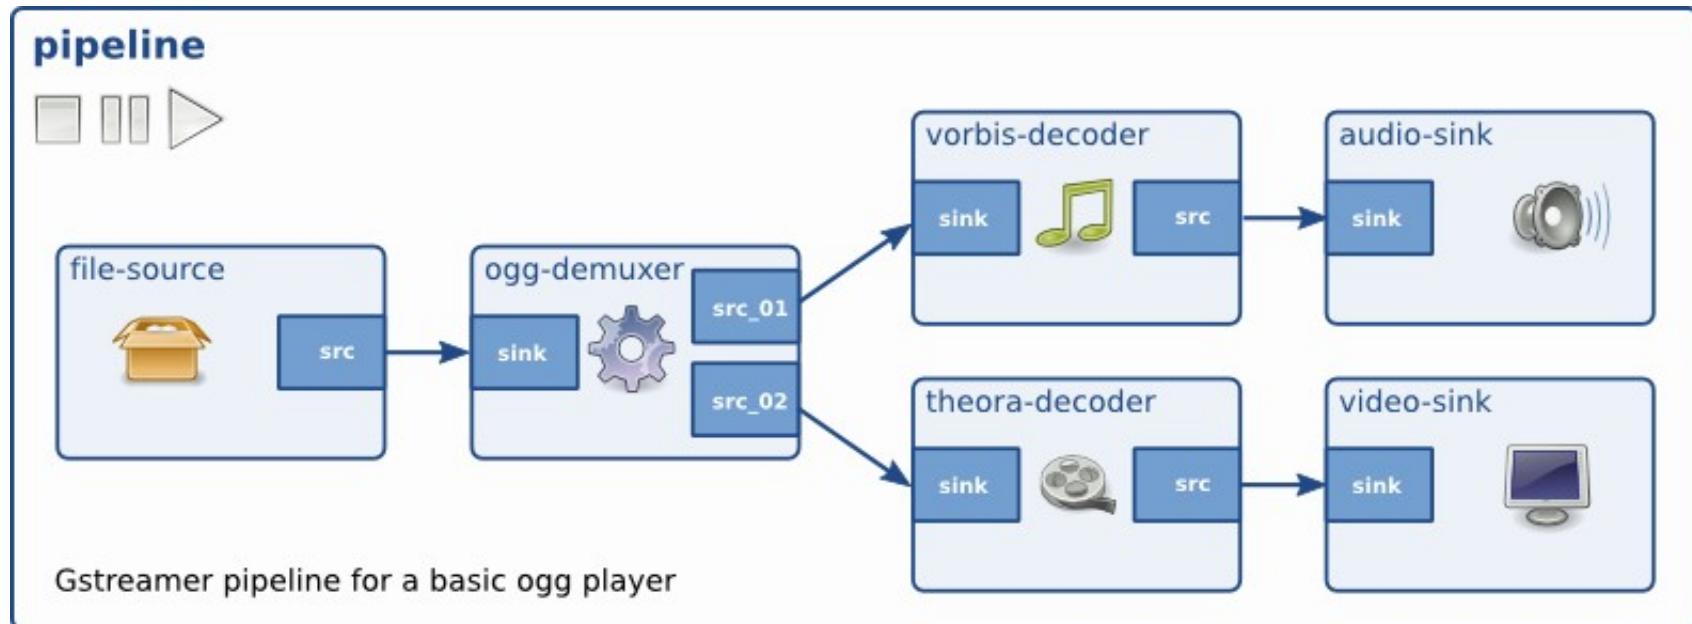

Bins & GhostPads

- GhostPads are proxies for internal pads
- Bin + GhostPads = hierarchical graphs

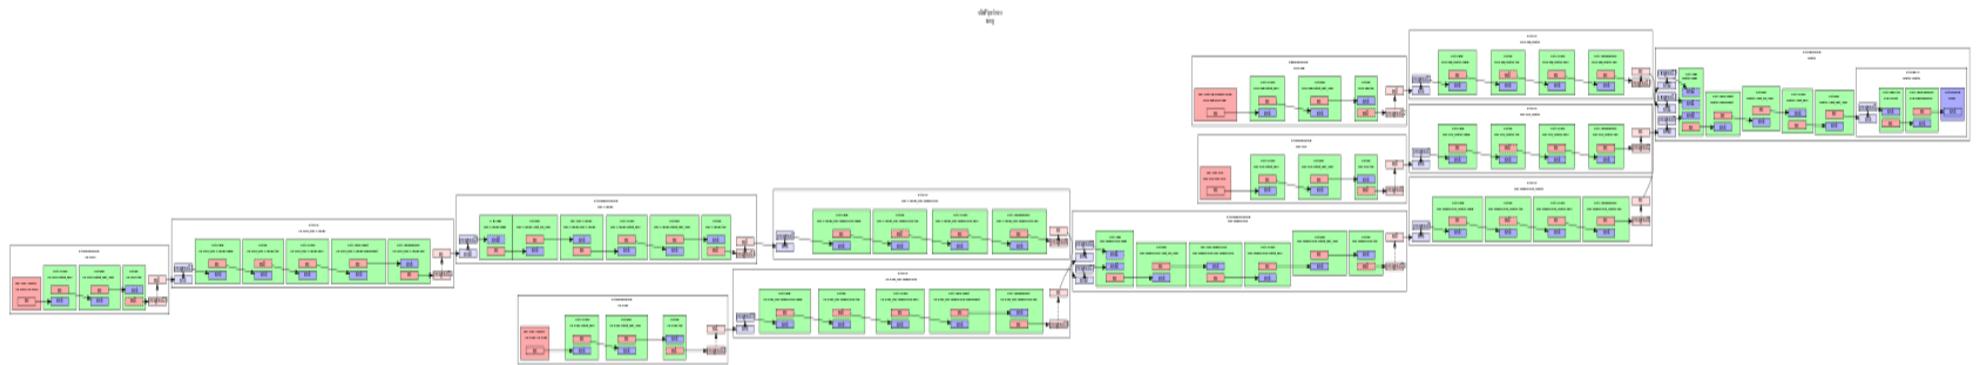

Pipeline

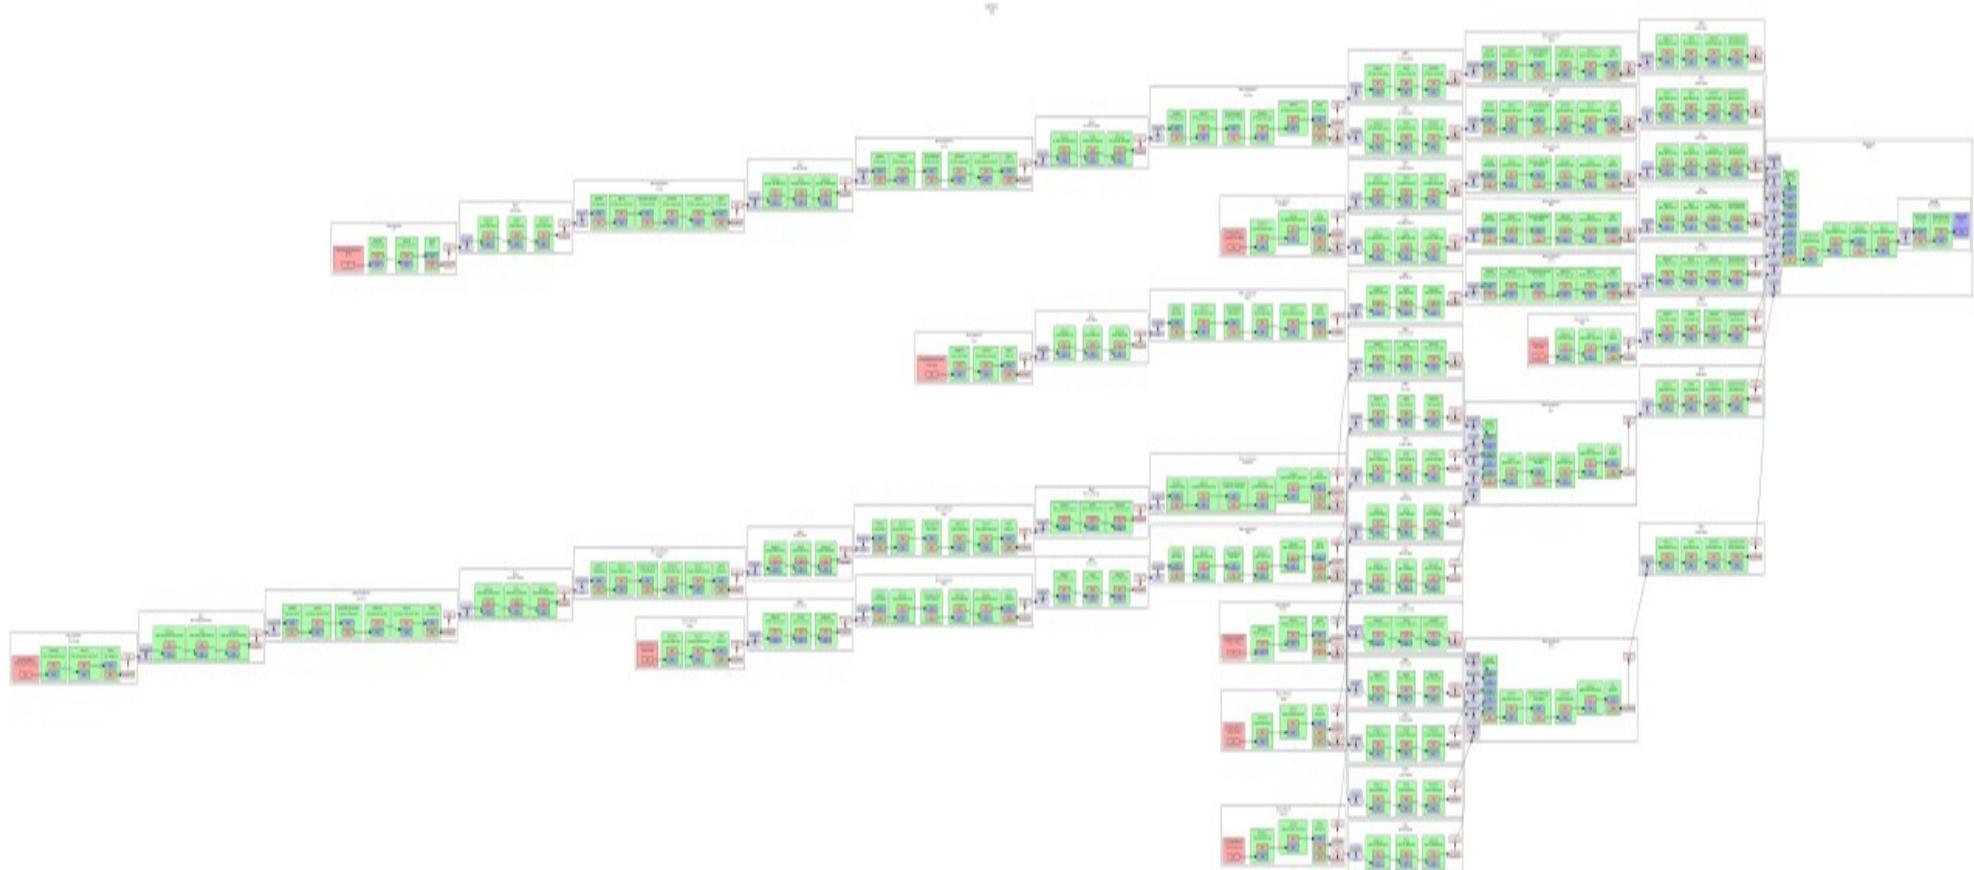

- Toplevel bin

Big Pipelines ?

Big Pipelines ?

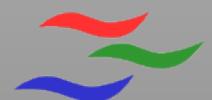

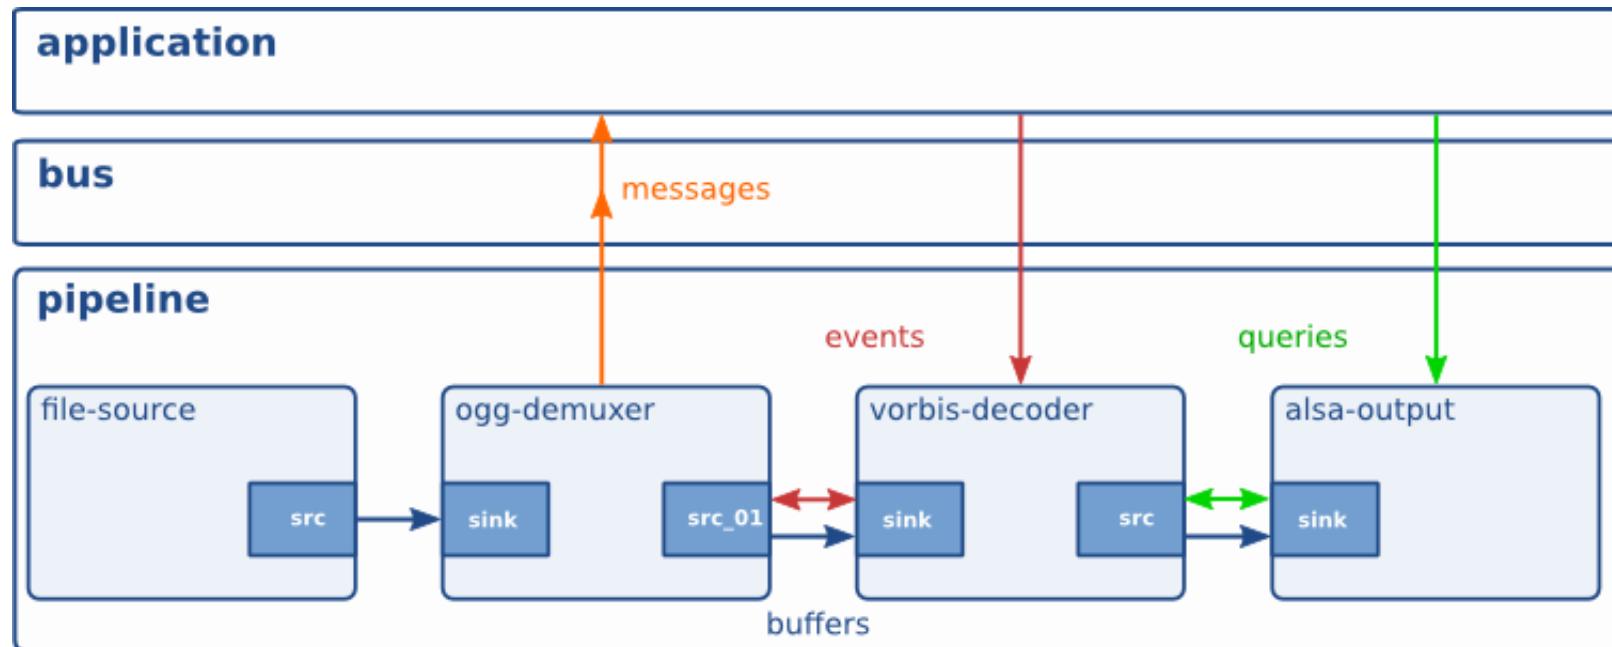

44 threads, 341 elements :)

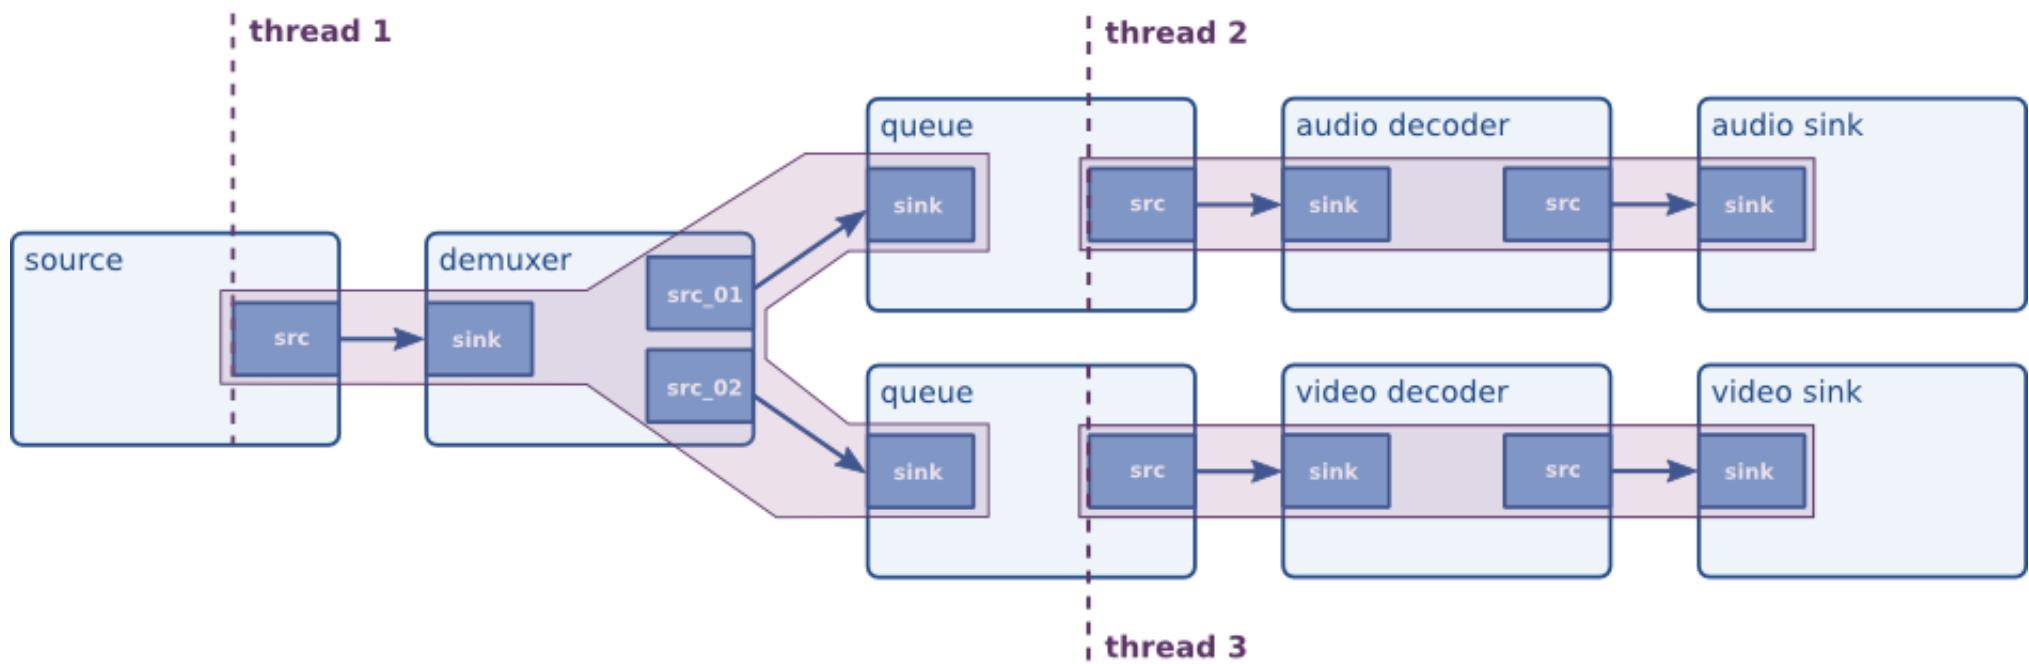

Communication

- Buffers, Events, Queries & Messages

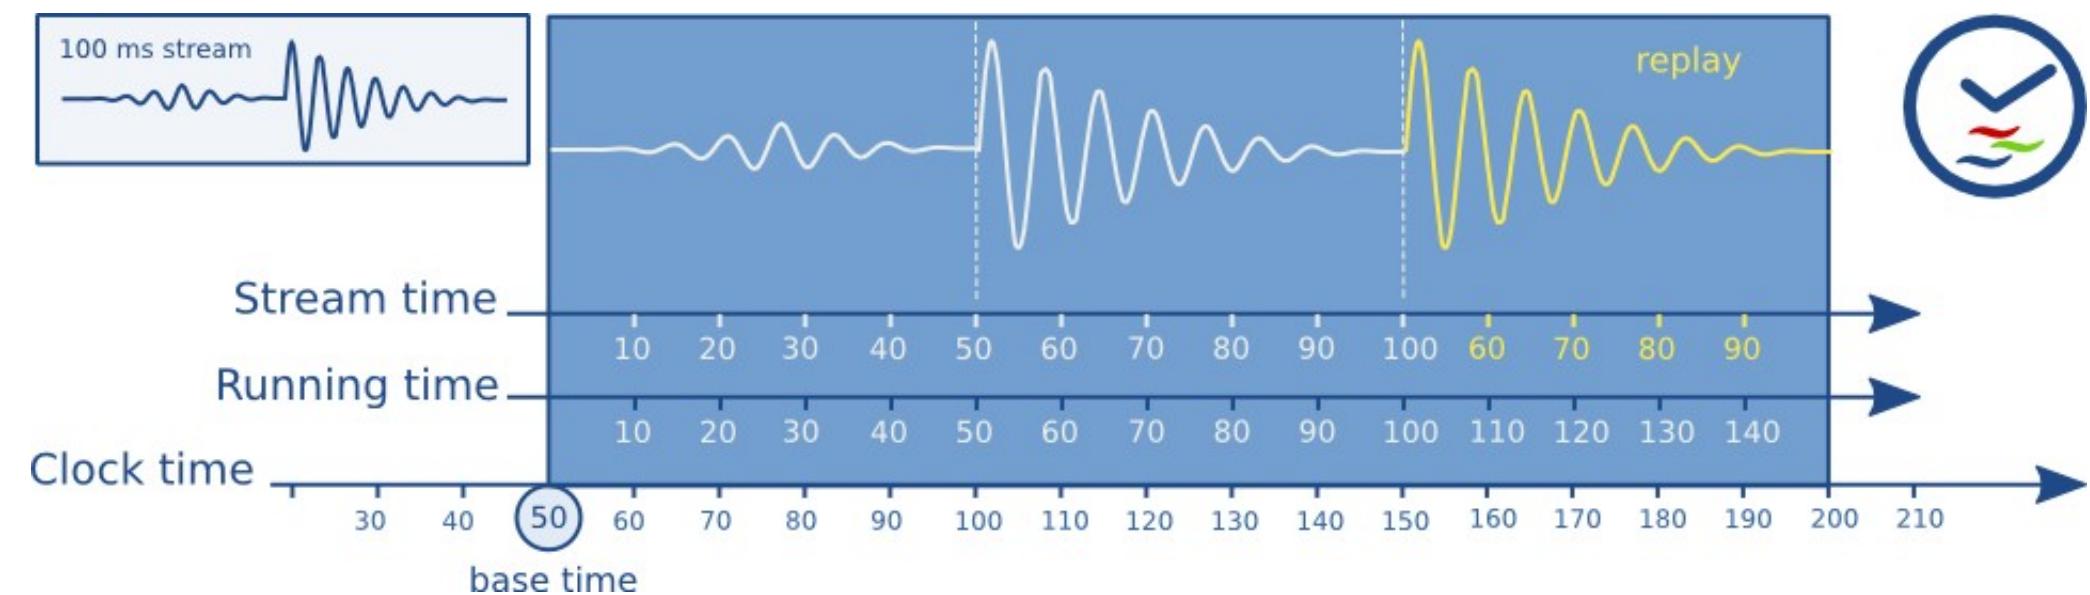

Threads

- Pads run in streaming threads

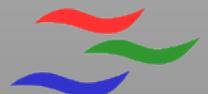

Clocks

- Elements can offer a clock
- The pipeline selects **one**
- All sinks synchronize to it

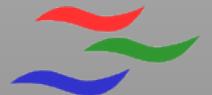

Element States

- NULL: inactive
- READY: check ressources
- PAUSED: preroll
- PLAYING: active dataflow, clocks are ticking

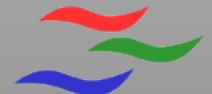

Plugins

- Provide system or user wide features
 - /usr/lib/gstreamer-0.10/
 - /home/user/.gstreamer-0.10/plugins/
- Features are element factories, type finders, etc.

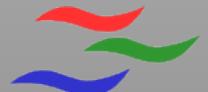

Registry

- Cache of plugins and the plugin features
 - Introspected from available plugins
- Automatically checked at startup
- Updated if needed

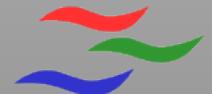

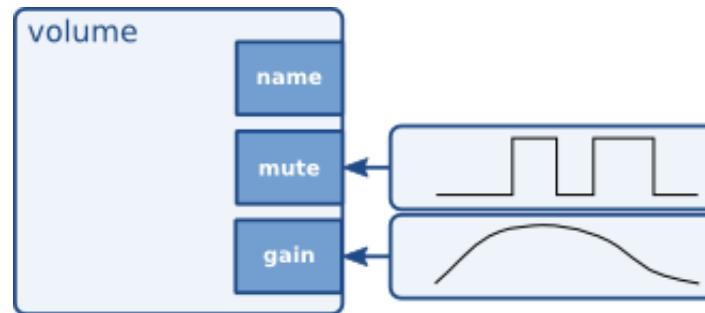

Audio Elements

- Audio I/O
 - alsa, jack, pulse, esound, oss, ...
- Tools
 - audioconvert, audiosample, adder, (de)interleave
- Effects
 - a few native (~15), ladspa, lv2, buzzmachines
- Muxers, Demuxer and Codecs

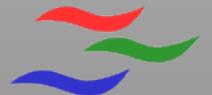

Sequencer

- GstController subsystem
- Time based parameter changes

A simple C Example

- 145 lines of C for a stupid sound sequence
- Simple pipeline
simsyn ! audiodelay ! autoaudiosink
- Sequencer controls "simsyn"

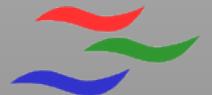

Resources

Thank you !

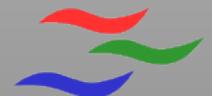

Some statistics

- 10 years of development
- ~500 contributor (30 active)

GObject

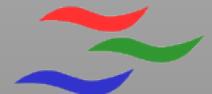

- Written in C, but still OO
- We're using GObject
 - Inheritance
 - Interfaces
 - Introspectable properties
 - Signals

Logging

- Powerful logging subsystem
- Level, categories, ...
- Run apps with:

```
GST_DEBUG="*:2,GST_CAPS:4" ./myapp
```

Pipeline dumps

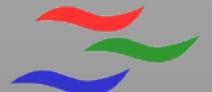

- Dump pipelines as graphviz graphs
- Use dot to render them
- Run apps with:

```
GST_DEBUG_DUMP_DOT_DIR=$PWD ./myapp
```

Tools

- `gst-inspect`
 - Show known plugins
- `gst-launch`
 - Run pipelines on the fly

Tools

- **gst-inspector**

<http://cgit.freedesktop.org/~cymacs/gst-inspector/>

- **gst-debug-viewer**

<http://cgit.freedesktop.org/~cymacs/gst-debug-viewer/>

- **gst-gengui**

<http://code.google.com/p/gst-gengui/>

- **gst-tracelib**

<http://cgit.freedesktop.org/~ensonic/gst-tracelib/>

Writing own plugins

- fdo git repo has a template module
 - App template
 - Plugin template
- Or find a similar plugin and copy'n'paste
 - All plugin packages have gst/ext/sys dirs
 - Gst – no dependencies
 - Ext – external library dependecies
 - Sys – platform dependencies (kernel)
